Introduction

Glass is a unique material for the expression of art and craft. Amongst all material, it offers the highest degree of flexibility for shaping into a wide variety of products varying in design, forms, color and appearance. Firozabad with the changing time has entered in to new era of glass manufacturing. It has become a major hub of glass products and has registered its global presence, diversifying its industrial base.

Place

Firozabad is located in western Uttar Pradesh, 40 km from Agra, at the northern edge of the Deccan Plateau. It is a huge industrial base for glass manufacturing and provides employment to a lot of craftsmen in and around the city. Most of the units in the city run twenty-four hours. They use pot furnace, regenerative tank furnace or fully automatic furnace for making glassware. The first two use natural gas burners instead of coal and are made of firebricks. The product range includes bangles, bottles, plates, containers, bulb shells, toys, vases etc. These are made only on order. Half of the production of these industries is exported.

People

The people of the city are a hard working lot. They work in the factories that are extremely hot and noisy. One can barely even hear the person standing next to him. Still, they go about their daily activities with ease and effortlessness. Usually men work in the factories and women back home. More than half the city's workforce is engaged in manufacturing activities. And the rest of them contribute indirectly to the chain by transporting, selling or buying the products.

Process

The most familiar type of glass used for centuries in windows and drinking vessels is soda-lime glass, composed of about 75% silica, sodium oxide, calcium oxide and several minor additives. For mass production, this type of glass is melted in large gas fired units. Glass is totally recyclable. There are different types of processes for making bangles, tableware (glass-blowing) and small items like toys, idols for worship etc. (glass-fusing).

Manual

A stream of molten glass, at its plastic temperature (1050°C-1200°C), is cut with a shearing blade to form a cylinder of glass, called a gob. The process starts with the gob falling, by gravity, and guided into the blank moulds, two halves that are clamped shut. Akarigar blows air into the hollow pipe from the other end to make the glass take the shape of the mould. Water is sprinkled over the mould to cool it off after every piece. The vessel is then picked up from the mould and kept to cool. As glass cools, it shrinks and solidifies. Uneven cooling causes weak glass due to stress and break. For even cooling, these are kept into an annealing oven that heats the container to about 580°C then cools it. Similar process is followed for making plates too but the only difference is that air is not blown into the pipe to make the plate take the shape of the mould. Molten glass is pressed in between two metallic die plates.

Automatic

The glass shells of bulbs (that we use at home) are all made by the 'forming machines'. These are fully automatic. Generally powered by compressed air, the mechanisms are timed to coordinate the movement of all the parts of the machine. Silica is fed into the furnace once at the beginning and that keeps forming the molten glass that is the necessary ingredient for making any product. Temperature controller monitors the temperature of each component of the machine. Once ready, the shell falls off gradually on to various conveyor belts of controlled temperature. The rejects of the entire process are put back into the furnace for recycling. One more quality check is done manually and the product is ready to be packaged and shipped.

Bangle Making

Bangles are also made with soda glass. Coloring agents are added to the molten glass in the furnace. The craftsman gets this from the furnace on a metallic pipe and gives it to another. He puts a thin 'taar' (wire) of this glass onto a rod that constantly rotates on a motor. So the thin glass coils around the rod and takes the shape of the bangle. These rods are of different diameters depending on the size of the bangle to be made. One more craftsman sitting at the other end of the furnace holds a big metallic ruler or a pointed tool that prevents the bangles from sticking with each other. When the entire rod gets filled up, the bangles are removed and another glass stream is added. The entire coiling process generates a long glass spring of sorts. This is cut using a diamond cutter. This is what separates each bangle from the other. Now since these are open ended and not complete circles, these are taken home by another set of workers to be finished. They melt the glass slightly to join the open ends. This is called 'kaanchtaankna' (stitching the glass). The bangles are further etched upon and polished to be sold in the market.

Glass Fusing

Glass-fusing is another very interesting process to make products that require fine detailing. Pratish kumar has been practicing this for the last twenty years. He works fourteen hours everyday and makes the most astonishing idols for worship - Radha Krishna, Ganesha, Shiva Parvati, Ram Sita etc. His basic raw materials include 'Chinese glass' (borosilicate glass that melts at a higher temperature than ordinary silicate glass), natural gas and oxygen burners, iron tong, carbon base (that doesn't burn with heat) and golden polish (to highlight the features of the figurines). He prefers using Chinese glass tubes because they are absolutely clear and don't crack like the locally available soda glass. This is sourced from the market in Firozabad itself and costs about three hundred rupees a tube. After melting and fusing glass into the product he wants to make, he paint it golden and sends it for another round of firing that makes the gold 'pakka'. One of his kids is learning the craft from him and helps him in packing his products by cotton-wrapping them and putting them in boxes. Customers buy these products from Pratish's home directly.

Products

Shops in Firozabad sell a lot of locally produced items as well as a lot of imported glass products from China and Italy. The range includes jars, candle stands, glasses, flower vases, electric wares such as decorative lights, bulbs, Gods and Goddesses, bangles etc. Sometimes, these articles are painted with vivid colors and innovative patterns. Etching is done on some to enhance their beauty.
