## Introduction

The course has introduced varieties of techniques for communicating or representing ideas/concepts on paper. The main areas of presentation are outlined below:

1. Preliminary Sketches
2. Development Sketches
3. Working Drawings
4. Presentation Drawings

These stages describe the whole design process from the finest thoughts and ideas about a problem to the final rendered solution.

### 1. Preliminary Sketches:

This stage includes-a simple investigation of the problem, research notes and sketches, a series of annotated sketches (sketches and notes) outlining initial level of thoughts and ideas.

Annotated sketches help in representing/ externalizing information and ideas down on paper.

- Sketches are used to convey information related to shape, form and overall appearance.
- Notes are added for indicating possible details such as fixing methods, manufacture methods, and other important general points. Many ideas/concepts need to be generated in the initial stage.
- These can be represented in the form of diagrams, drawings, illustrations etc.

### 2. Development Sketches:

These are used to transform the initial level vague or rough ideas from preliminary sketches into workable solutions ready for drawing up to scale.

### 3. Working Drawings:

This stage generates a varied selection of sketches or drawings. A scale drawing will help to finalize the dimensions and proportions carried forward from the development sketches stage. The main purpose of working drawings is to provide all the information needed to make the artifact/product. Important techniques in this stage are outlined below:

#### a. Orthographic Projections:

Give specific information about dimensions and materials and this type of projection includes assembly drawings or part drawings.

### b. Pictorial Views:

These are commonly used to provide instructions for assembly and these views include:

- Dimensions
- Sections
- Detail views
- Exploded views

Pictorial views will give a clear idea about how to make the product.

### 4. Presentation Drawings:

These are required to give an exact drawn up and rendered representation to look like the made-up or final product.

A drawing and sketching vocabulary of design:

- While designing a product the most important thing to be considered is the product's intended function.
- Aesthetic requirements of the design such as the product's appearance, finish, look & feel are also of important.

### Consideration:

#### • Line:

Line can be used in many ways and can represent valuable information. They can be used to indicate movement in a particular direction. It can also be used in ways, which will create a visual rhythm (flow). Various combinations of lines can create the impression of textured surfaces. Lines can be used to represent an area or shape.

#### • Shape:

Shape can be created by drawing random curved lines, which cross each other. Straight lines can be used in the same way. Curved and straight lines can be used together to create impression of shape or spaces and outlines.

#### • Plane:

Plane refers to a flat, smooth surface. One can use a plane as a base in which to work and he can add further planes by overlapping, penetrating, joining and so on. This way many interesting compositions can be created.

#### • Grids:

Grids can be created out of tessellating (interlocking) geometric shapes like triangles, rectangles, equilateral triangles, hexagons etc.

#### • Form:

To describe a **form** one has to give details of all its characteristics-shape, size, proportion, weight, opacity, colour and texture.

<https://www.dsource.in/course/design-drawing-and-representation/introduction>

Two dimensional **shapes** define specific areas. When shape is used in connection with a three-dimensional form it defines the overall outline of the object.

It is important to study **natural** forms such as leaves, insects, fish, fruit, wood, stones, and any animate and inanimate objects in the nature. Detailed knowledge of the internal and external structure of these natural forms is required in order to make analytical drawings of these forms.

- **Size:**

Size is a relative concept and one relies upon comparisons to describe the magnitude of an object.

- **Proportions:**

Proportions refers to the relationship of one part of a form to another part and gives an object its particular compositions.

## Design Tools

### Fundamentals of Colour:

Fundamentals of Colour is a comprehensive design learning tool developed by IDC, IIT Bombay. It is an interactive webspace where students and aspiring designers can learn about colour, its attributes and multiple applications. The tool is divided into three chapters.

First is the Colour Overview containing colour basics and colour schemes. The second chapter Colour Attributes contains technical aspects of colour such as Temperature and Contrast, Hue, Saturation and Value and Colour and Its Varied context. The third chapter is Colour Applications. Along with studying colour, applying that knowledge becomes necessary for one's learning process.

The Fundamentals of colour tool can be a demonstrative tool for teachers to show the scope of colour. For beginner design students it can play a role of developing colour sensitivity to produce high-quality and informed design. It can also be used as a self-study tool/ revision tool.

For more information visit: <https://www.dsource.in/tool/colour/>

### Grids Tool:

A grid is a skeleton to create clarity and consistency on the page and improve design comprehension. It is to establish a set of guidelines for how elements should be positioned within a layout providing the rhythm for a design.

The tool introduces you to design terminologies of the grid through a section called 'parts of grids'. You can also learn about the types of grids that are widely used, understand how they affect a layout by choosing and changing elements like text, images etc.

Design Course

## Design Drawing and Representation

The Art of Illustration

by

Ms. Jagriti Galphade

NID, Bengaluru

Source:

<https://www.dsource.in/course/design-drawing-and-representation/design-tools>

This tool also introduces you to Indian grids. India has been using complex grids since centuries to build structures and patterns that are seen even in Indian households. The rangoli is one such example. Indians use grids effortlessly without even realizing, to draw complex patterns that are always pleasing to the eye. The Indian Grids section collates usage of grids in various fields like - Indian Architecture, Sculpture, Floorgraphics (Rangoli), Yantra (patterns) and Textiles.

Have fun exploring the world of Grids!
