Abstract

Language can mean different things to different people. How and why it is learned plays an important role in the education system. In a country like India, with so many languages, languages can also play a divisive role and is essential to creating a national identity and fostering inclusivity. We look at the current language learning policies and try to identify problem areas that require design interventions.

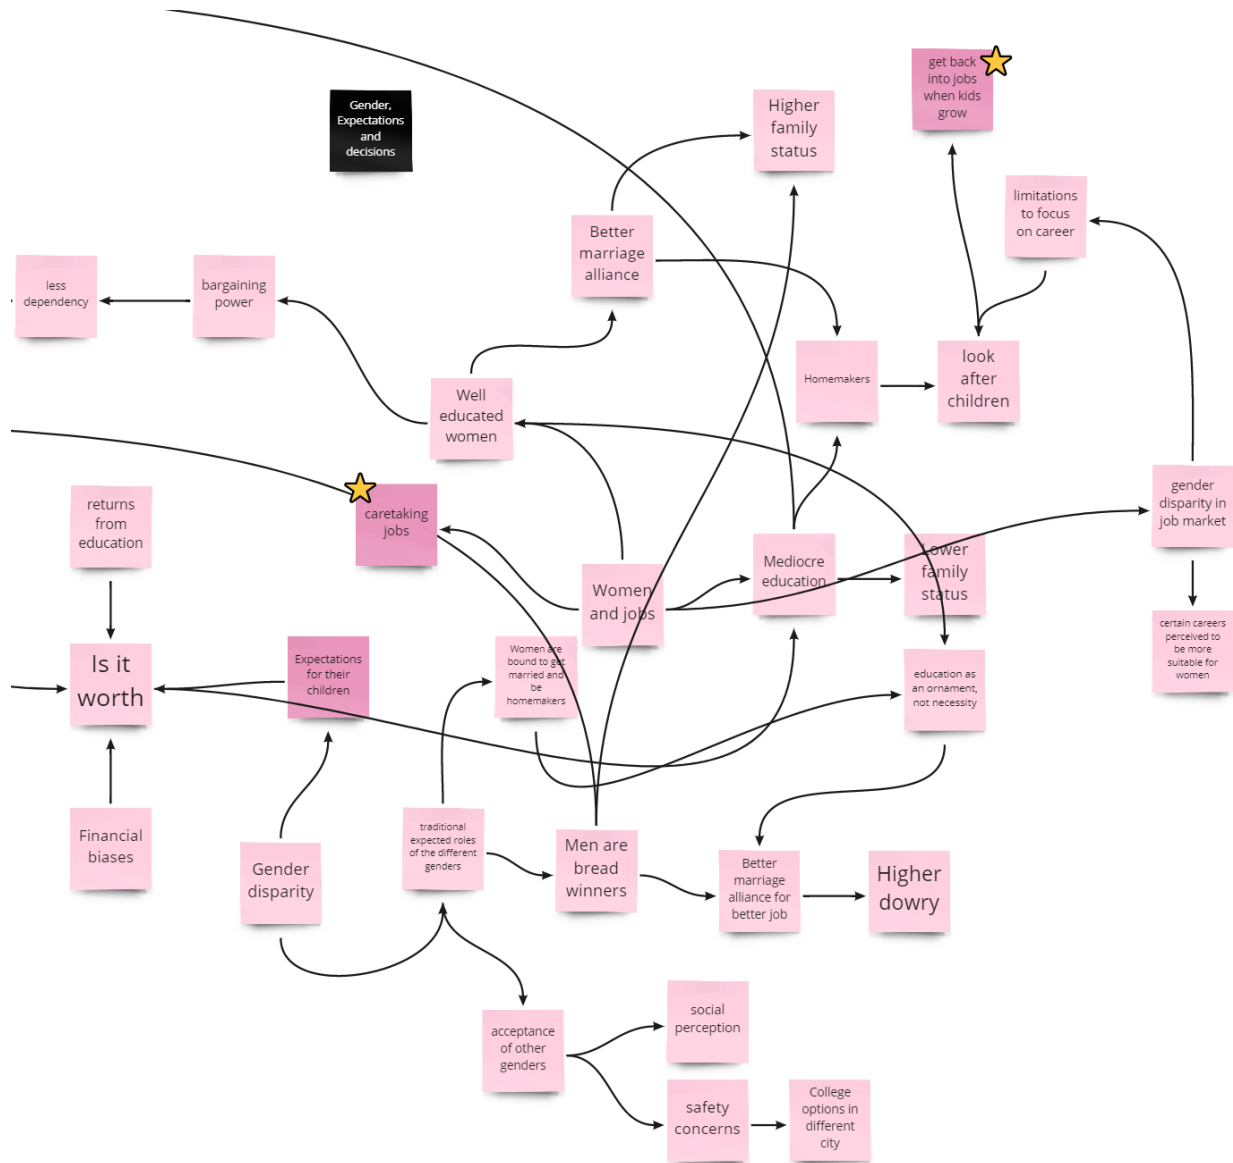

System mapping

We started out mapping the entire Indian education system, trying to create separate causal loops for linked parts of the super-system. All the below-mentioned topics were mapped out in the process of identifying a suitable problem area that would be worth working on.

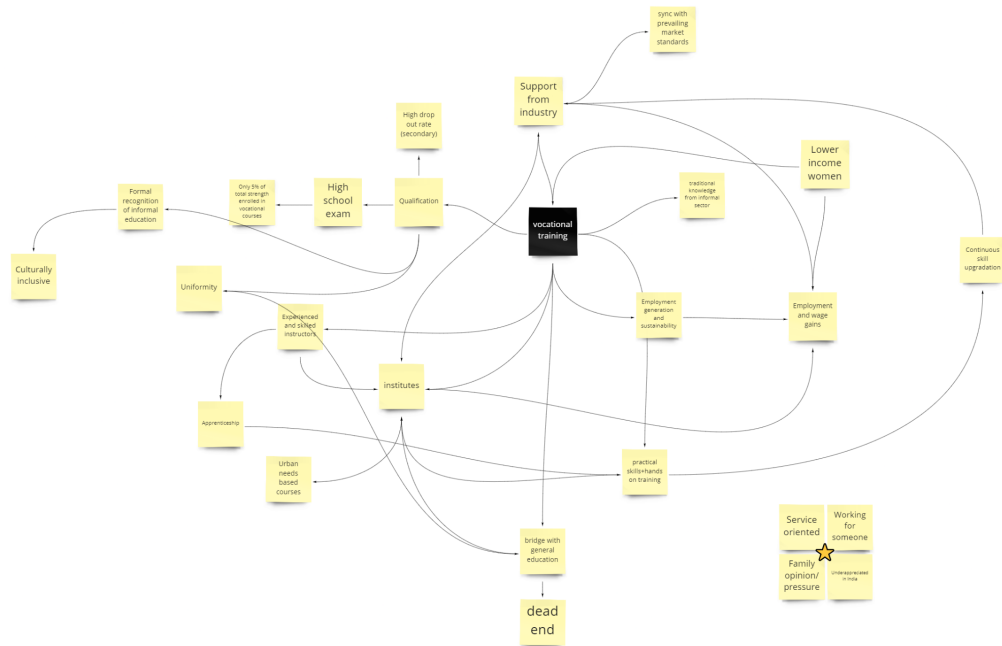

Expectations after education

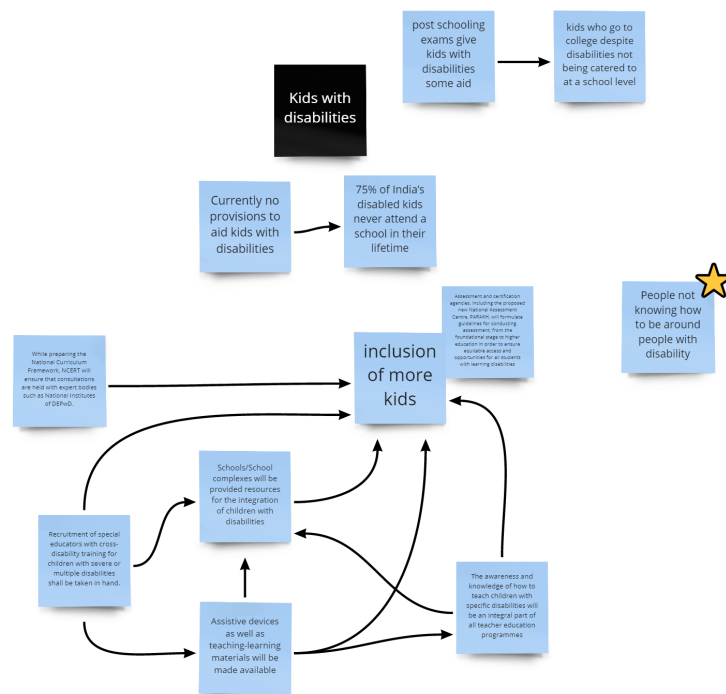

Gender, Expectations and decisions

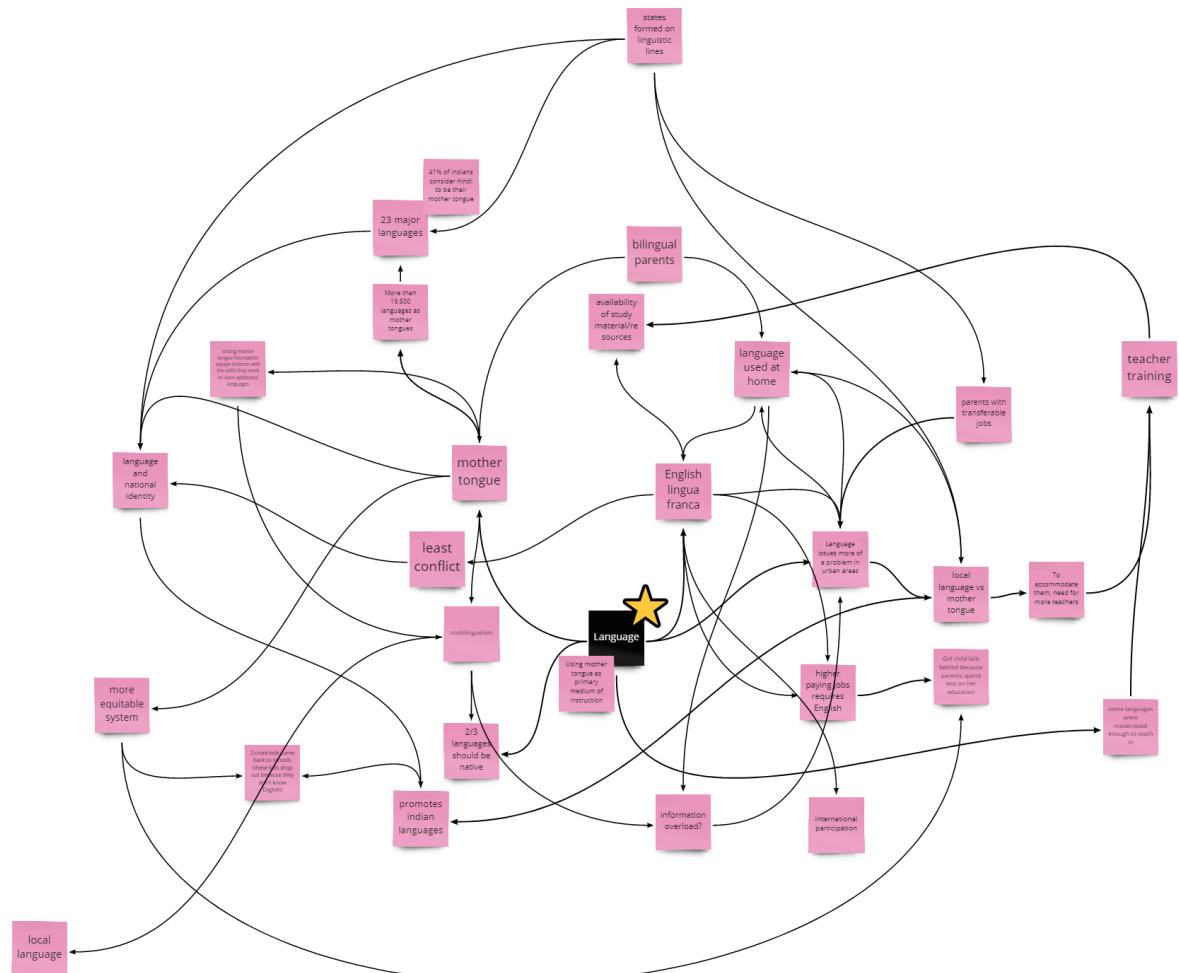

Vocational training

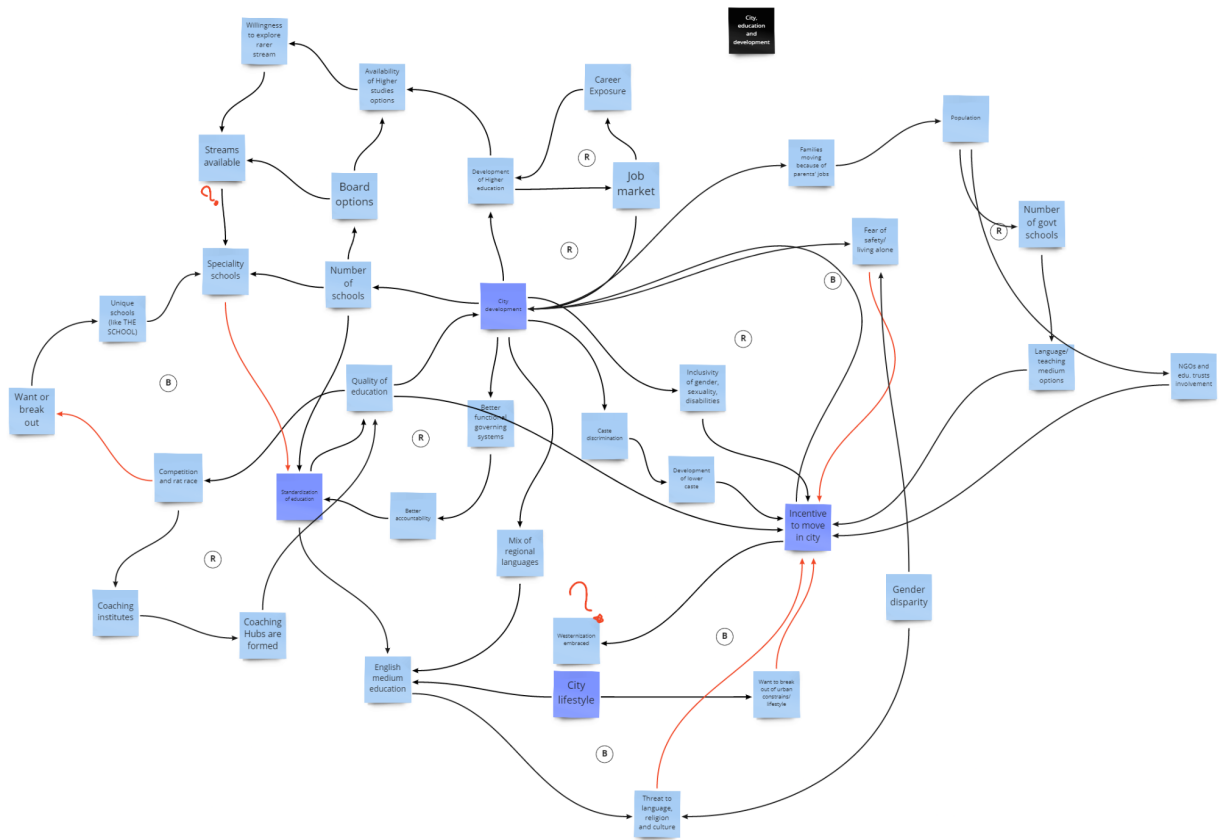

Kids with disabilities

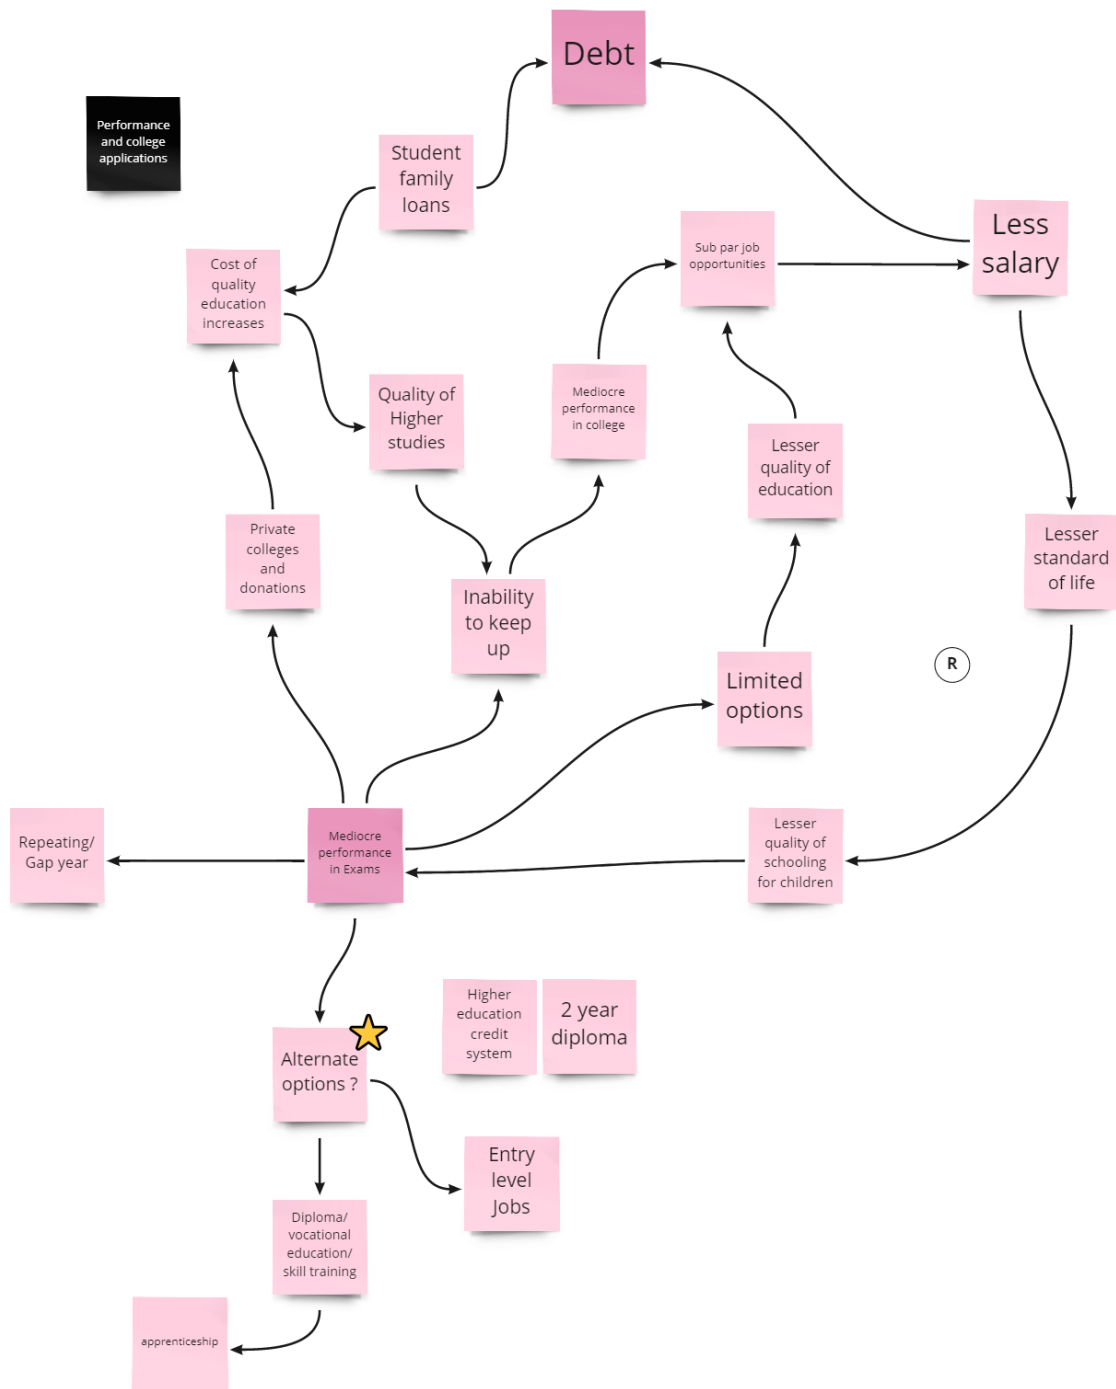

Language

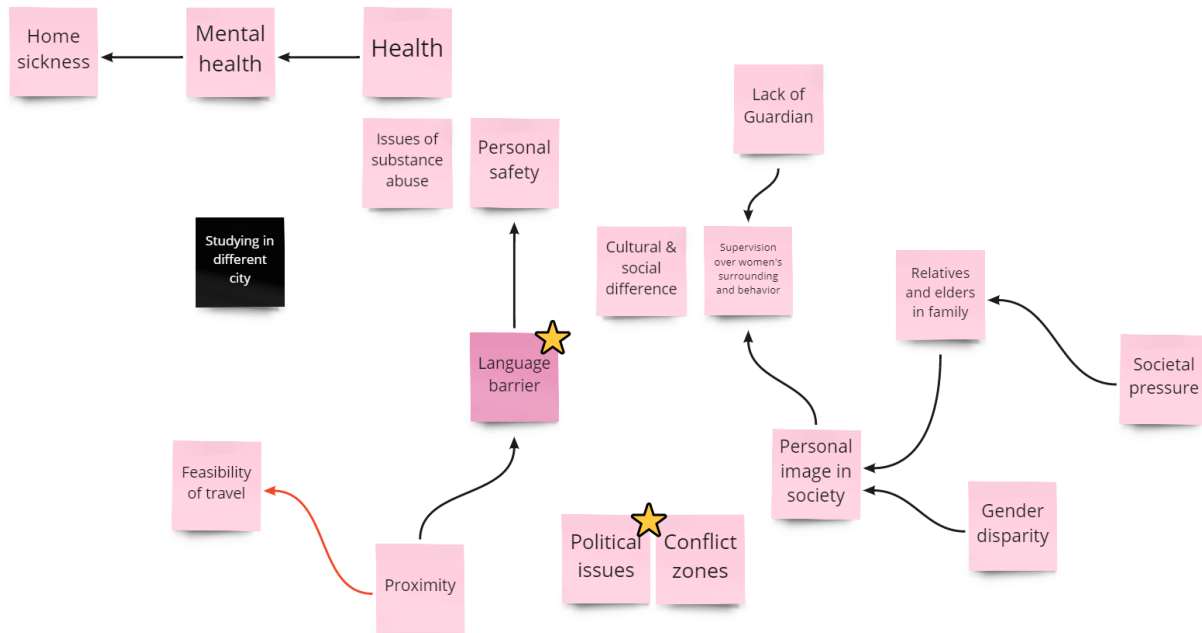

City, education and development

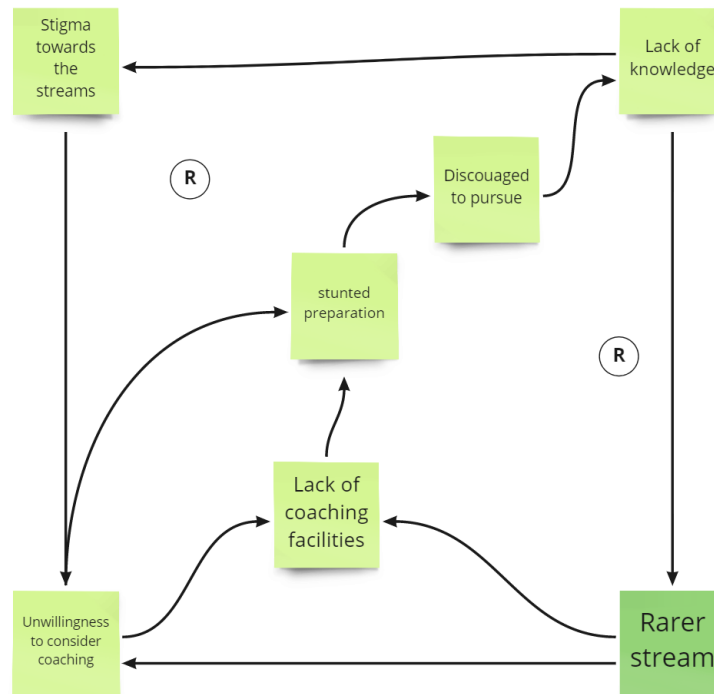

Performance and College application

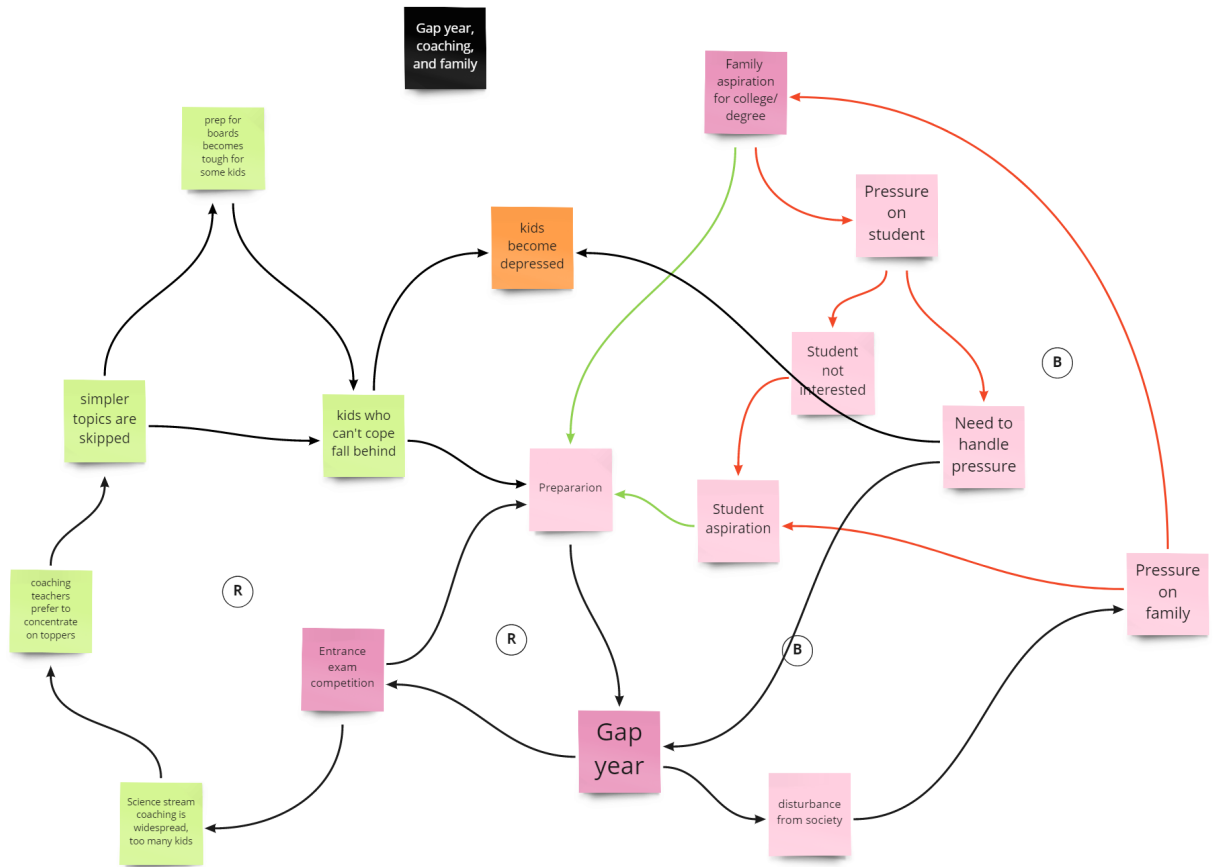

Studying in different city

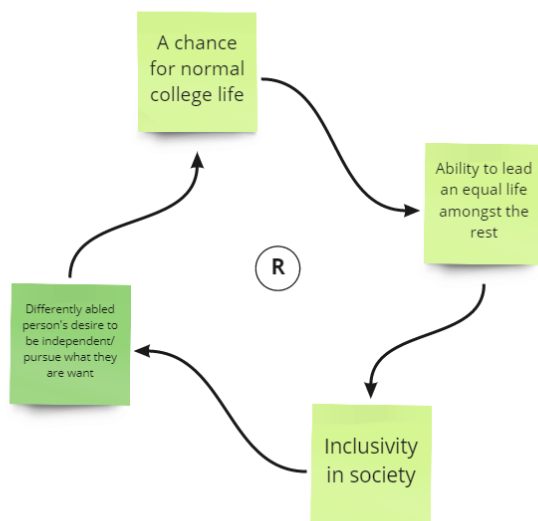

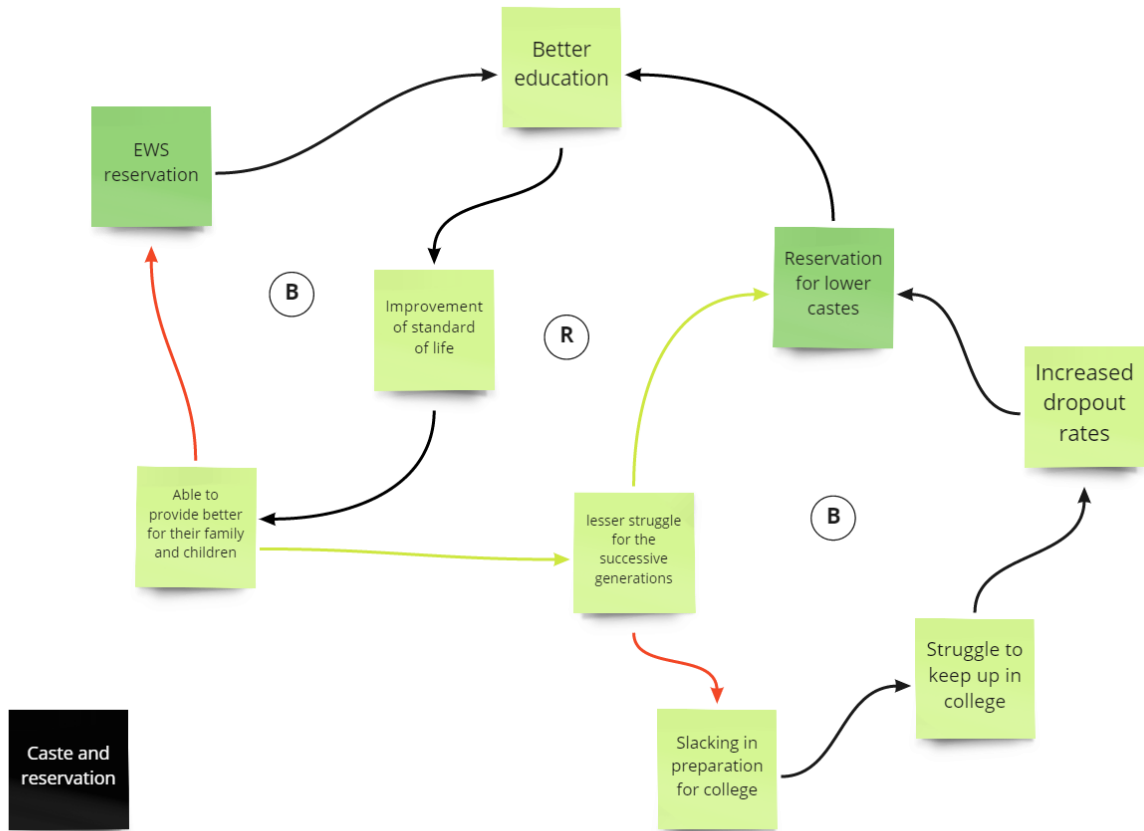

Coaching, preparation and stream

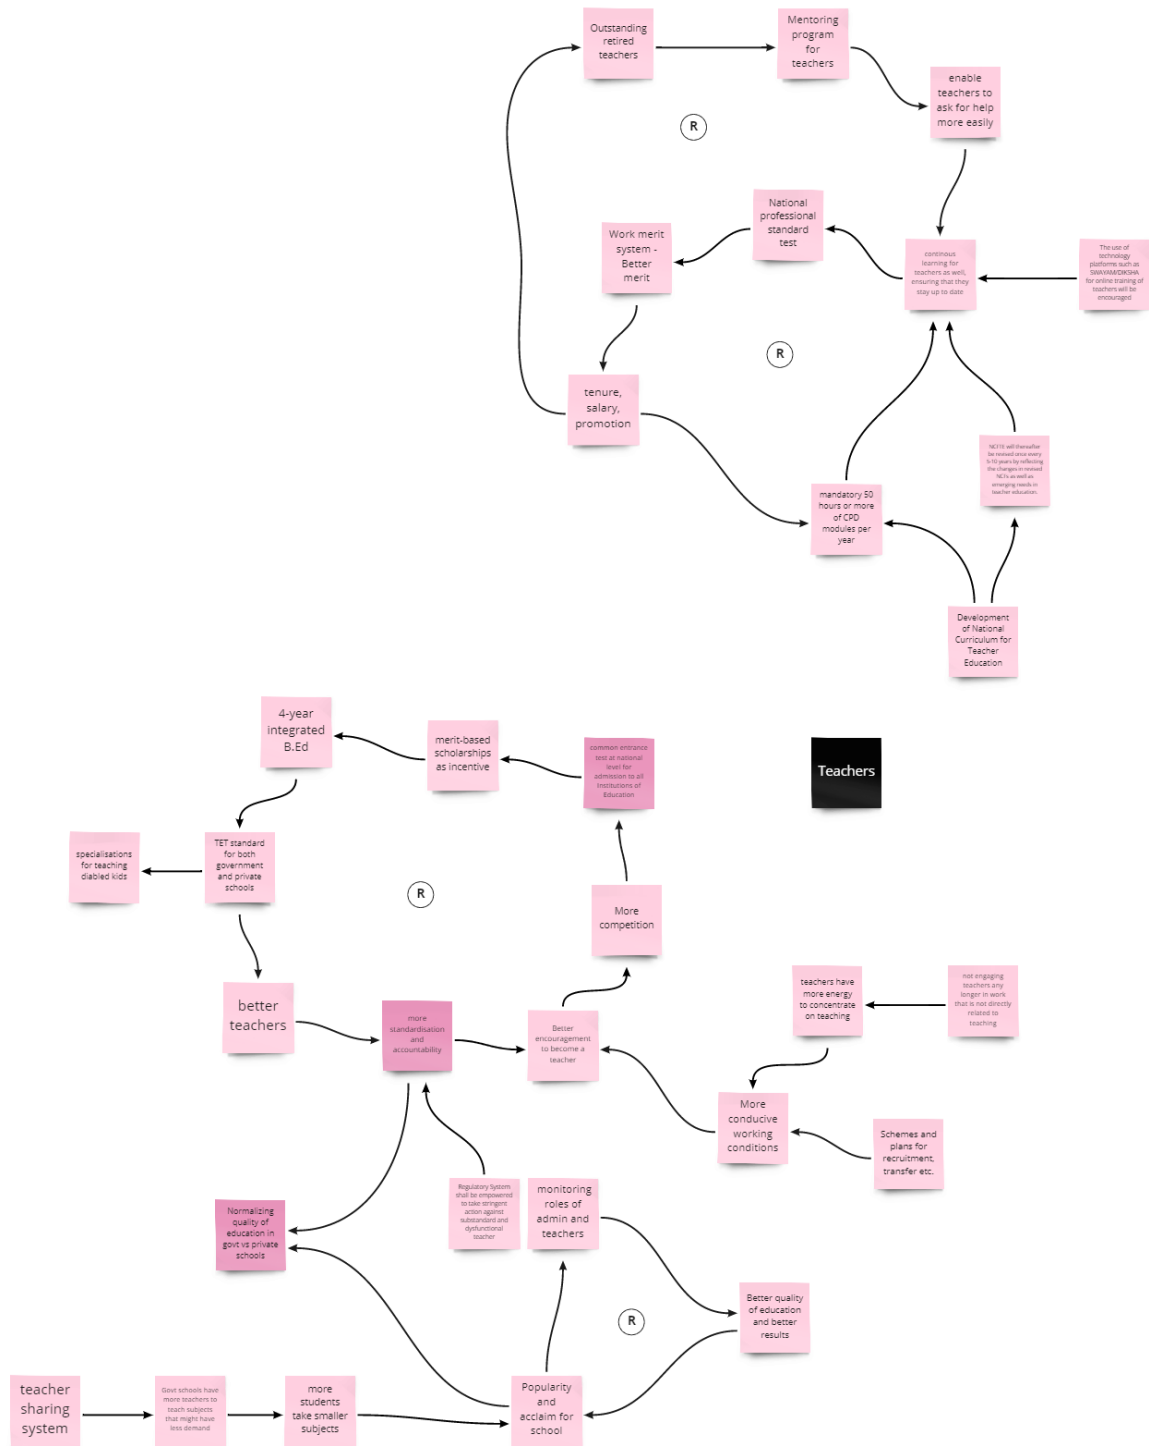

Gap year, coaching, and family

Caste and reservation

Teachers

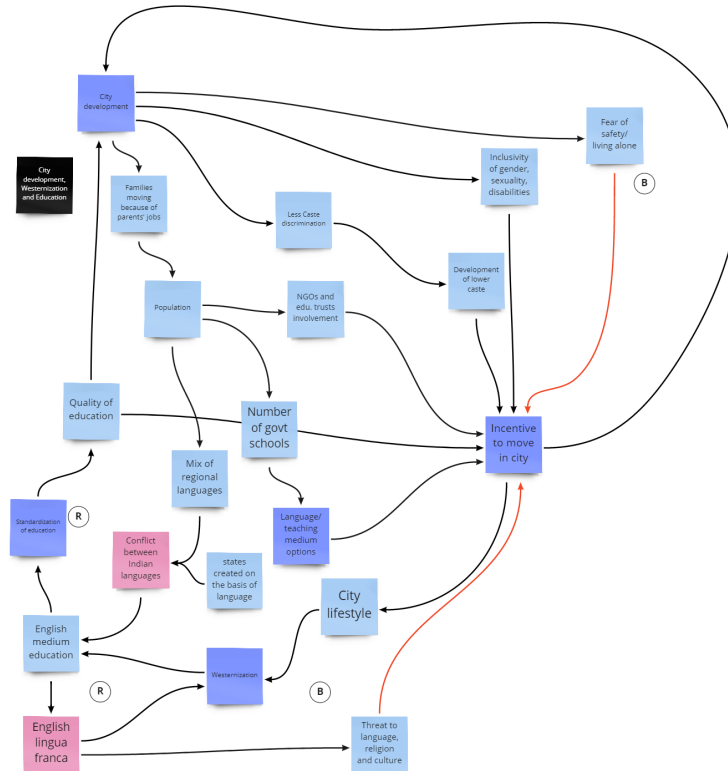

Problem Areas and sub-system Mapping

This is where we define the problem area and further map out its sub-parts to better understand it. We made a list of all the problem areas we identified and further prioritized them. Language was the part which we decided to focus on as it had its influence and issues in most parts of the system. It also is a key segment of the 2020 NEP. Taking Prof. Promod's advice, we went ahead.

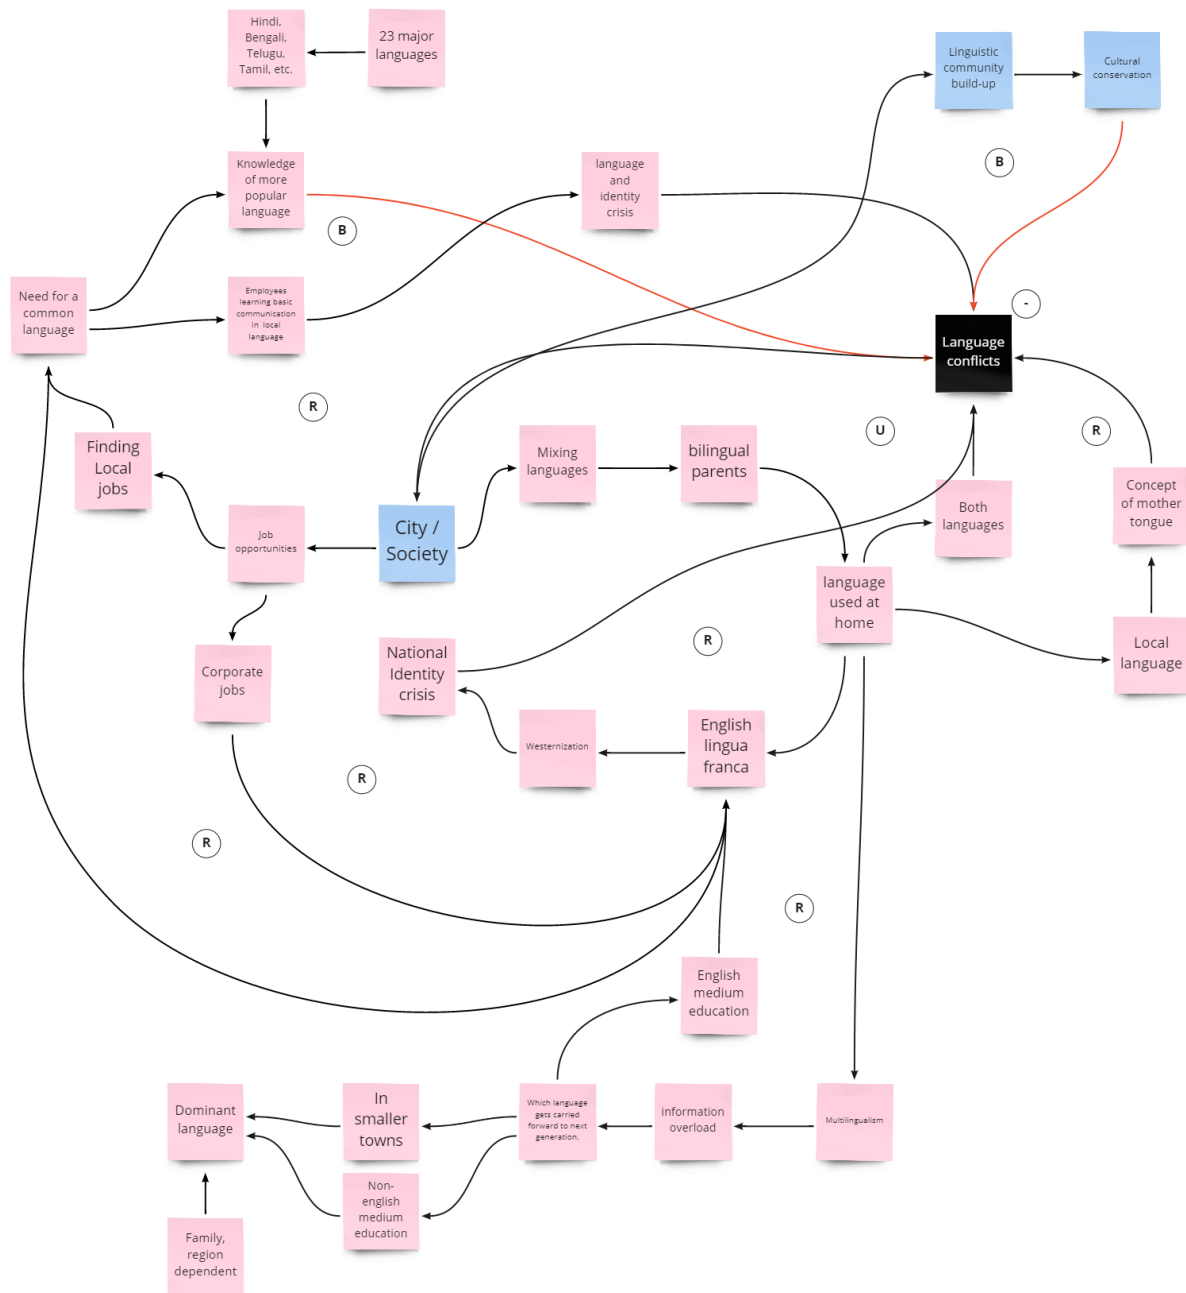

We realized the importance of Urban society and education with language and decided that this would be like a backdrop on which we looked at everything. With some framework, we took the existing mapping done for language to start from.\

Further making causal loops of subparts including looking at Urban development, westernization and education and the behaviors of people, the conflicts of language within a society, and the threats and benefits of the knowledge of different languages in regional, familial and personal identity contexts.

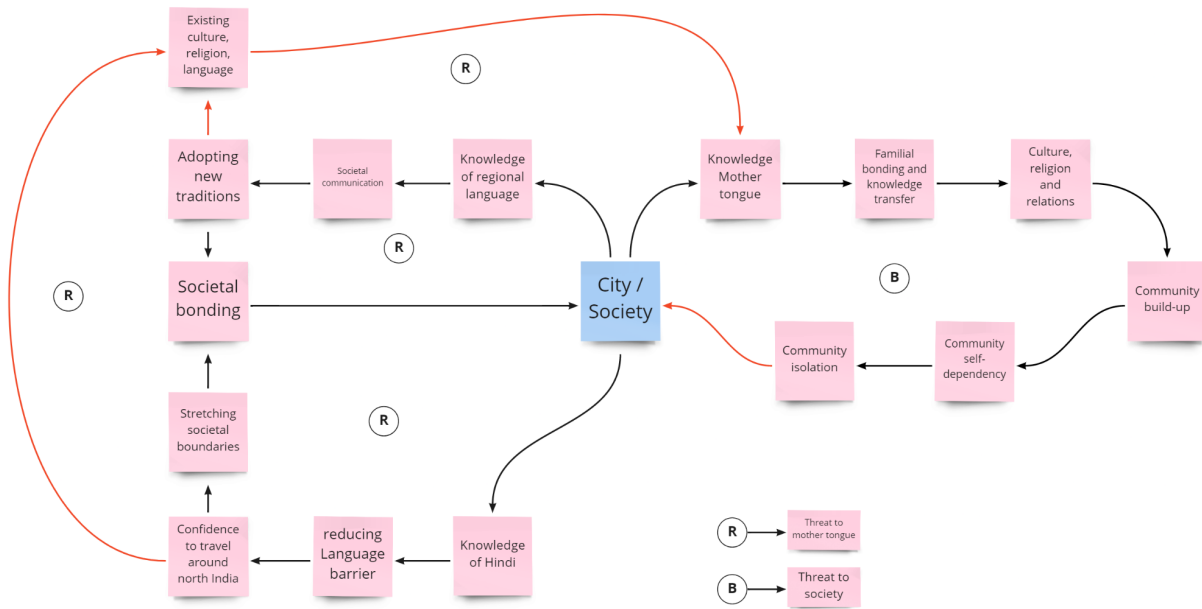

Urban development, Westernization and Education

Society & Language conflicts

Threats & Benefits

Research and Insights

Learning a Language

Learning multiple languages impacts a child's cognitive abilities and is shown to enhance a variety of non-verbal skills including conflict resolution. Studies have shown that it is easiest to pick up languages between the ages 5 to 7 as the brain naturally acquires language skills before and during this period whereas in the later years, it is consciously learnt. However, educators also need to ensure that students aren't overwhelmed with an overload of information.

Geo-political conflicts

We took a look at the languages offered in different states around the country and their reasons for doing the same. The North-South divide was also examined.

3 Language policy and English

The current 3-Language policy as highlighted in NEP 2020 and its evolution from the 60s were analysed. It was also concluded that people, especially in urban spaces and among the middle and upper class, viewed English as a symbol of better life.

Insights

One of our major insights was how people viewed English. It was associated with liberalism as opposed to native languages and was perceived to hold a kind of transformative power. This attitude also reflects on the kinds of aspirations for the future and the returns people expect from the investment they make towards education. We also looked at how multilingual homes in urban spaces tended to use English as the language spoken at home. City building and development also plays an important role in the attitude towards vernacular languages. However focussing on English can also accentuate the already existing gender divide in the country.

Considering the fact that the formation of Indian states were based on linguistic divides, we also took a look at the role language plays in an individual/community's cultural identity, the conflicts involved with learning a new language and how it hinders finding a compromise amongst the various parties involved.

Problems Identified and Ideation

From the insights we found, we took a few problem areas and ideated a few possible solutions for them.

Development of city is a major element

Current policies, teacher distribution and infrastructure gives kids studying in major cities a huge advantage over the other kids because the development of a city impacts the education the child has. This can be turned into a level playing field but making policy changes.

Community build up is a natural way of handling threat to culture or religion

When people have a common ground and area to socialise with their linguistic communities (like an app), they keep in touch with their heritage

Regional language conflicts and westernisation

Language being a huge part of identity finds itself often at the center of conflict between many states in the country or in conflict happening when south indians feel like Hindi is being imposed on them. Educating people against fear and insecurity about new languages may reduce the conflicts that take place.

Gender Disparity with respect to language

Girl child education is still considered as less important compared to male education in rural areas and economically backward urban areas. NEP can potentially cause a gap between the quality of education of both genders in this respect (where boys might end up learning english much faster than girls). To mitigate this issue one solution is to put forth some policies (affirmative action), create more campaigns on girl child education, or address the root causes girls end up dropping out of school (housework, lack of facilities, etc.)

Multilingual homes end up using English as their common language

Campaigns to stress the importance of mother tongues and keeping in touch with our heritage can help combat this rapid westernisation.

Expectations from education, returns from investments

Revamping how kids are taught language can help them set more realistic goals which they can achieve. This can be achieved by changing the curriculum and training teachers to teach kids in a certain way instead of another.

Inclusivity

By promoting cross culture activities and global partnerships or even country wide participation, we can bridge the gap and bring different communities closer.

National Identity and Brain Drain

By promoting and celebrating multilingualism and our heritage, we can unite communities and possibly create strong bonds which could hopefully reduce brain drain. We can do this by the method of storytelling through educational infomercials.

“Why us and not them?”

To ease the tension between hindi and regional languages we can try to gradually shift people's attitudes about other languages through educational infomercials and storytelling.

Different Needs

Indian schools can be broadly classified into 4 types (elite private schools, private schools, government schools with adequate english education and government schools unable to provide good english education), they all have different requirements and needs but under current policies, they are all treated the same. Creating a different curriculum for the different types keeping in mind their language learning needs can immensely help kids study and get ready for the job market. Creating a second and third language curriculum based on needs and wants could benefit more than rote learning of grammar currently taking place in these schools. English should be taught to kids (or as a medium of instruction) based on the needs of the children in that particular school.

Next Steps

1. Finalizing idea.
2. In-depth research and ideation for the problem.
3. Identifying target sector and stakeholders.
